

Dr. Randy Medeiros

Thomas University

I have worked in the vocational rehabilitation field for 18 years. I became a CRC to enhance my skills in working with people who have disabilities. Shortly after I received my CRC, I had the opportunity to work with a client who was blind at birth. He had the dream of owning his own business but never thought this dream would come true. As part of the rehabilitation team, I listened to the client talk about his aspiration of becoming a business owner. With my education as a CRC and my knowledge of assistive work technology, I was a part of the rehabilitation team that was able to make his dream of becoming a business owner a reality. As an Assistive Work Technologist, I was able to make the recommendations needed to help the client become successful in his business (i.e., computer, iPad, and cutting-edge technology to start his business). The client participated in a training program that taught him to use business-related computer software to generate spreadsheets for sales, expense reports, profit/loss margins, etc. He was able to develop skills for money handling and how to properly make bank deposits. He went from getting a disability check to owning his own successful snack bar business. As a CRC, you will help make a difference in the lives of people who have a disability and help them on the road to success in many different ways. I have seen that once an individual learns technology, it enhances their skills and empowers them to reach new heights they never thought they could achieve. Becoming a Certified Rehabilitation Counselor gives you the opportunity to inspire others to reach their goals.
